

Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application.

Listing of Claims

Claims 1-19 Canceled.

20. (Currently Amended) A method for communication between a client computer and a server computer, wherein both the client computer and the server computer use the hypertext transfer protocol (HTTP) and the client computer uses an HTTP-browser, the method comprising:

 sending a first request from the client computer to the server computer;
 upon receiving the first request from the client computer, the server computer establishing a session by allocating a resource at the server computer, the resource including an identifier, and returning, to the browser at the client computer and in response to the first request, a predetermined close instruction ~~to the browser at the client computer~~, the predetermined close instruction carrying the identifier identifying the session at the server computer resource to be de-allocated when the identifier is returned from the browser upon unloading, the predetermined close instruction representative of a start of a communication session between the client computer and the server computer;

 upon unloading at the browser the predetermined close instruction received from the server computer, sending a second request from the client computer to the server computer to indicate initiation of the predetermined close instruction by the

browser, the second request carrying the identifier and indicating to de-allocate the resource at the server computer, the predetermined close instruction, when received, preventing the browser from using content in a cache at the client computer, such that the browser uses content from the server computer, the predetermined close instruction including a time-out period representative of an idle time associated with a lack of content page requests from the client computer to the server computer, the server computer de-allocating the resource when the idle time reaches the time-out period, wherein upon unloading includes at least one of a closing of the browser and a navigating away to another page presented at the browser; and

upon receiving the second-request from the client computer, the server computer de-allocating the resource.

21. (Previously Presented) The method of claim 20, wherein after the server computer has returned the predetermined close instruction, and before the server computer receives the second request from the client computer, the server computer consecutively sends content pages to the client computer.

22. (Previously Presented) The method of claim 21, wherein in the step returning a predetermined close instruction, the browser presents the close instruction in a first frame and presents the contents in a second frame.

23. (Previously Presented) The method of claim 21, wherein the close instruction prevents selected content pages from being cached by the browser.

24. (Previously Presented) The method of claim 20, wherein in the step sending a second request, the client computer sends the second request to a predetermined address of the server computer.

25. (Previously Presented) The method of claim 20, wherein in the step returning a predetermined close instruction, the predetermined close instruction comprises script.

26. (Previously Presented) The method of claim 20, wherein in the step returning a predetermined close instruction, the script does not lead to a presentation by the browser.

27. (Currently Amended) A computer program product for HTTP communication between a client computer and a server computer, wherein the client computer includes a browser, the computer program product including program code portions embodied in a computer readable storage medium that cause a client processor in the client computer and a server processor in the server computer to control the communication, the computer program product further comprising:

code portions that cause the client processor to send a first request to the server computer;

code portions that - upon receiving from the client computer the first request by the server computer - cause the server processor to allocate a resource at

the server computer, the resource including an identifier, and return, to the browser and
in response to the first request, a predetermined close instruction ~~to the browser at the~~
~~client computer~~, the predetermined close instruction carrying the identifier identifying the
session at the server computer to be de-allocated when the identifier is returned from
the browser upon unloading, the predetermined close instruction representative of a
start of a communication session between the client computer and the server computer;

code portions that upon unloading at the browser the predetermined close
instruction received from the server computer - cause the client processor to send a
second request to the server computer to indicate initiation of the predetermined close
instruction by the browser, the second request carrying the identifier and indicating to
de-allocate the resource at the server computer, the predetermined close instruction,
when received, preventing the browser from using content in a cache at the client
computer, such that the browser uses content from the server computer, the
predetermined close instruction including a time-out period representative of an idle
time associated with a lack of content page requests from the client computer to the
server computer, the server computer de-allocating the resource when the idle time
reaches the time-out period, wherein upon unloading includes at least one of a closing
of the browser and a navigating away to another page presented at the browser; and
code portions that - upon receiving the second request from the client
computer - cause the server processor to de-allocate the resource.

28. (Previously Presented) The computer program product of claim 27,
wherein the code portions cause the client processor to provide such a close instruction

that the browser provides a first frame to present the close instruction in a first frame and provides a second frame to present content pages that the client computer receives from the server computer.

29. (Previously Presented) The computer program product of claim 27, wherein the code portions cause the client processor to provide such a close instruction that caching of selected content pages by the browser is prevented.

30. (Previously Presented) The computer program product of claim 27, wherein the code portions cause the client processor to provide such a close instruction that the client computer sends the second request to a predetermined address of the server computer.

31. (Previously Presented) A computer readable medium storing the program code portions of the computer program product of claim 27 that cause the client processor to operate.

32. (Previously Presented) A computer readable medium storing the program code portions of the computer program product of claim 27 that cause the server processor to operate.

33. (Currently Amended) A computer system including a client computer and a server computer, wherein both the client computer and the server computer use

HTTP for communication and the client computer uses an HTTP-browser, the computer system characterized in that:

the client computer sends a first request to the server computer;

the server computer upon receiving from the client computer the first request allocates a resource, the resource including an identifier, and returns, to the browser at the client computer and in response to the first request, a predetermined close instruction ~~to the browser of the client computer~~, the close instruction carrying the identifier identifying the session at the server computer to be de-allocated when the identifier is returned from the browser upon unloading, the predetermined close instruction representative of a start of a communication session between the client computer and the server computer;

the client computer, upon unloading at the browser the predetermined close instruction received from the server computer, sends a second request to the server computer to indicate initiation of the predetermined close instruction by the browser, the second request carrying the identifier and indicating to de-allocate the resource at the server, the predetermined close instruction, when received, preventing the browser from using content in a cache at the client computer, such that the browser uses content from the server computer, the predetermined close instruction including a time-out period representative of an idle time associated with a lack of content page requests from the client computer to the server computer, the server computer de-allocating the resource when the idle time reaches the time-out period, wherein upon unloading includes at least one of a closing of the browser and a navigating away to another page presented at the browser; and

the server computer, upon receiving the second request from the client computer, de-allocates the resource.

34. (Previously Presented) The computer system of claim 33, wherein the client computer presents the close instruction in a first frame and presents the content pages in a second frame.

35. (Previously Presented) The computer system of claim 33, wherein the server computer provides the close instruction such that in the client computer the close instruction prevents selected content pages from being cached by the browser.

Claims 36-38 Canceled.
